I have had these 3, 12V dimmer transformer Dedolights since I worked at the BBC many years ago and they have been constant and loyal friends. The transformers have packed up now but the lamp housing and optics remains as solid as ever. My aim is to attempt to DIY convert the light sources to LED and a colour temperature of approx 6000K, so I can mix them with my other daylight lighting. So ideally I am looking for a high output LED bulb to replace the halogens as a straight swop or, as is more likely, change the fitting altogether to get a high power 12V light source.

Help and suggestions would be most welcome. 
Thanks in advance
